rooter pot

The future in Plant Grafting

Commercial Benefits

- Virtually ensures results in 3-4 months on plants that may otherwise take several seasons to grow
- Economical and simple to maintain – all it requires is watering
- You can place several Rooter pots on each tree
- Transplantation only occurs when the plant has an extensive root system and so space is allocated only to growing plants
- The Rooter Pot is reusable

ALL PRICES ARE SUBJECT TO 10% GST

ROOTER POT SPECIFICATION

rooter pot

The future in Plant Grafting

The rooter pot has made aerial layering reliable, economical, simple to perform and suitable for Organic Agricultural methods.

Rooter pot is a prize winning, ingenious casing of articulated plastic with a conical body that prepares the plant for shock-free transplantation.

HOW IT WORKS

- Vertically hinged, so it can be clipped around the stem of the plant
- Locks and seals tightly, secured by quick closing fasteners
- Base reservoirs of water are perforated by cones, in order to facilitate both the ingress and ascent of water by capillary action through the soil.
- Excess water is released at the lower central base, ensuring no root damage through flooding
- The narrow canals on the inside walls prevent roots from touching the sides of the pot allowing them to grow to a geotropic pattern that is non-rotary downward in nature
- The Rooter Pot becomes a mini-greenhouse, with moisture levels kept constant to ensure rapid growth.
- Development of the root system can be monitored without opening the pot by removing the opaque stickers
